

Pollution over megacity regions from the Tropospheric Emission Spectrometer (TES)

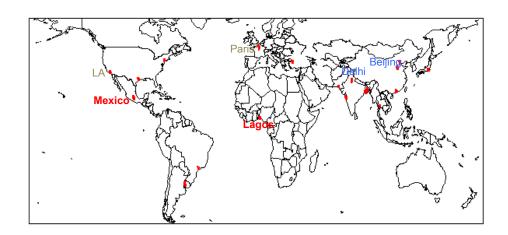

Karen Cady-Pereira¹, Jessica Neu², Vivienne Payne², Kevin Bowman², Kazuyuki Miyazaki³, Ming Luo², Rick Pernak¹, Jennifer Hegarty¹, Eloise Marais⁴

- 1. Atmospheric and Environmental Research (AER)
 - 2. Jet Propulsion Laboratory (JPL)
- 3. Japan Agency for Marine-Earth Science and Technology
 - 4. Harvard University

TES measures air quality

- January 2013: megacity observations start
 - simultaneous closely spaced observations
 - (~ 12 km apart)
 - O₃, CH₄, CO₂, NH₃, CH₃OH, HCOOH, PAN
 - quantify urban pollution production, transformation and export.

Model summary

GEOS-Chem

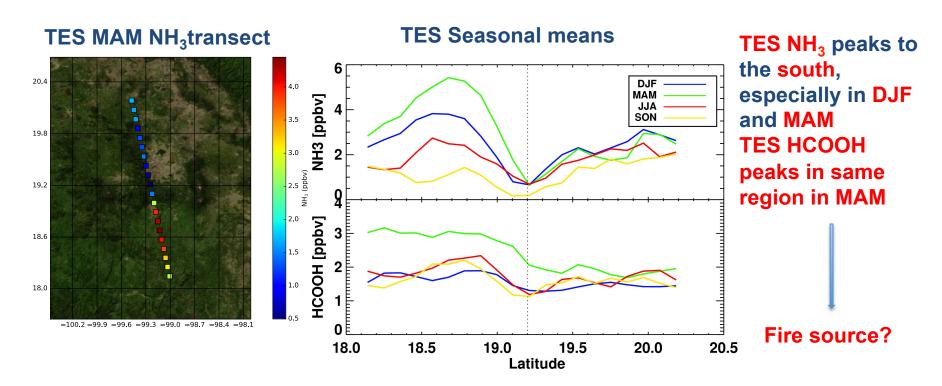

- Western Africa
- High resolution: 0.5x0.667 deg
- Includes NH₃ from
 - biomass burning (GFED4)
 - anthropogenic activity (EDGAR)
 - biofuel and charcoal
 - trash burning
- Only secondary HCOOH production
- Fixed CH₃OH

MIROC-Chem

- Mexico
- Lower resolution: 2.5x2.5 deg
- Focus on accurate O₃ chemistry modeling
- Limited NH₃ emissions
- No separate modeling of HCOOH
- Variable CH₃OH

NH₃ and HCOOH near Mexico City

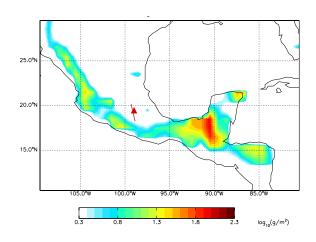

Focus on air quality near the surface:

→ will use means of TES data over the first two or three layers above the surface

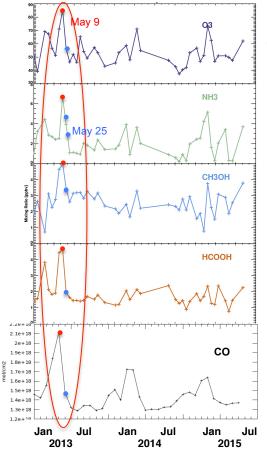

Biomass burning in Mexico

Biomass burning is strong over the Yucatan in the NH spring

Mean May GFED C emissions (1997-2010)

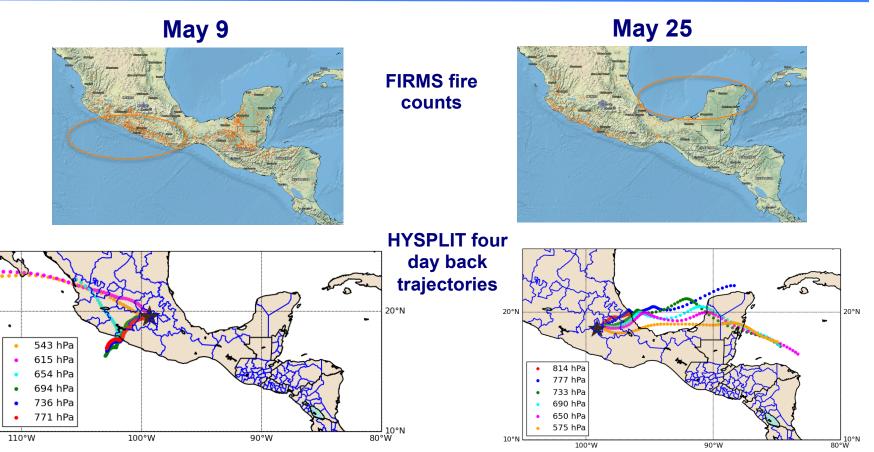

TES transect means

Concomitant
biomass burning
products (TES
methanol, formic
acid, ammonia) and
CO (from AIRS)
suggest that strong
fires might
contribute
significantly to
pollution in the
Mexico City area
during the BB
season

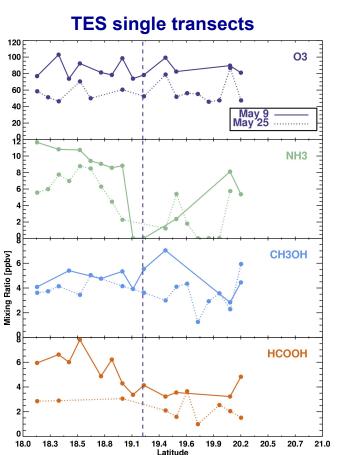

20°N

Possible BB sources

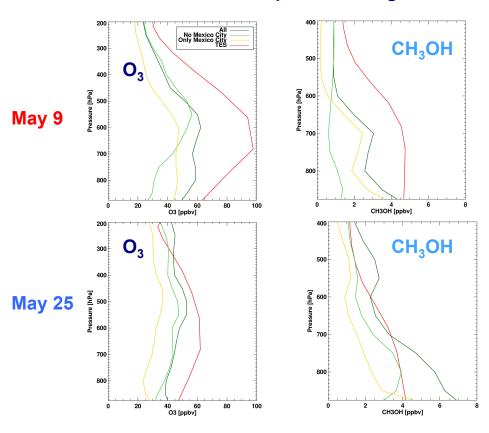

May 9 vs May 25

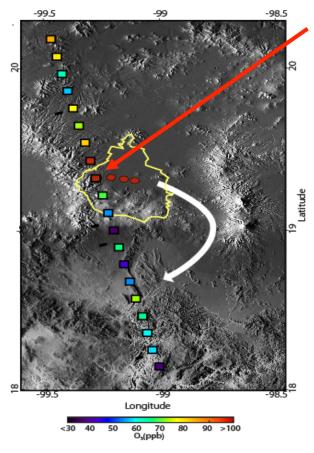

TES and MIROC mean profiles along transect

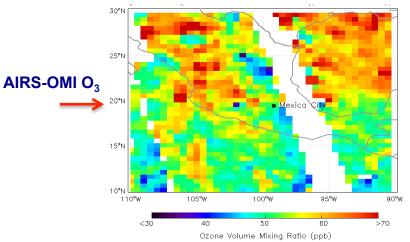

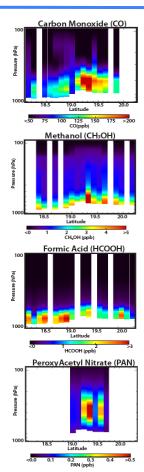

Mexico City October pollution event

Megacity Pollution: The jointly retrieved TES/ OMI near-surface ozone product shows very high ozone (~120 ppb) in Mexico City on a day with stable, stagnant air in the boundary layer.

TES carbon monoxide, methanol, & formic acid (ozone precursors) are also elevated, as is the nitrogen reservoir peroxyacetyl nitrate (PAN)

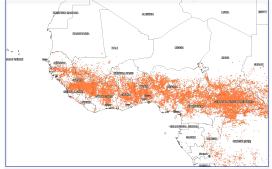

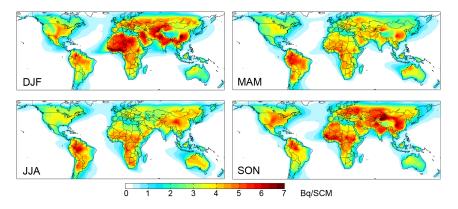

Western Africa- Lagos

Western Africa has one of the strongest biomass burning seasons (December-March) on Earth

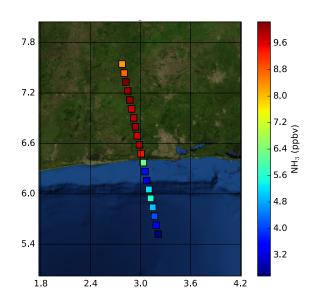

Fire counts Jan 28-Feb 9, 2013

GEOS-Chem ²²²Rn simulation

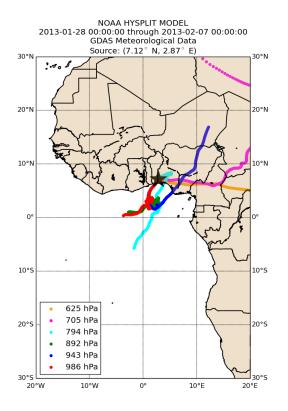

TES DJF NH₃ transect

High ²²²Rn in DJF due to stagnant air conditions

High pollution in DJF

Pollution sources

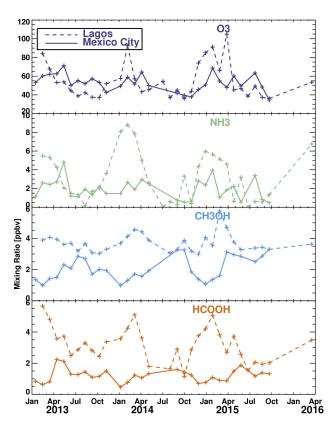

- Biomass burning
- Petrochemical
- Two-stroke engines
- Generators
- Trash burning
- Traffic

Sea breezes play important role

2015 El Nino may have also been influential

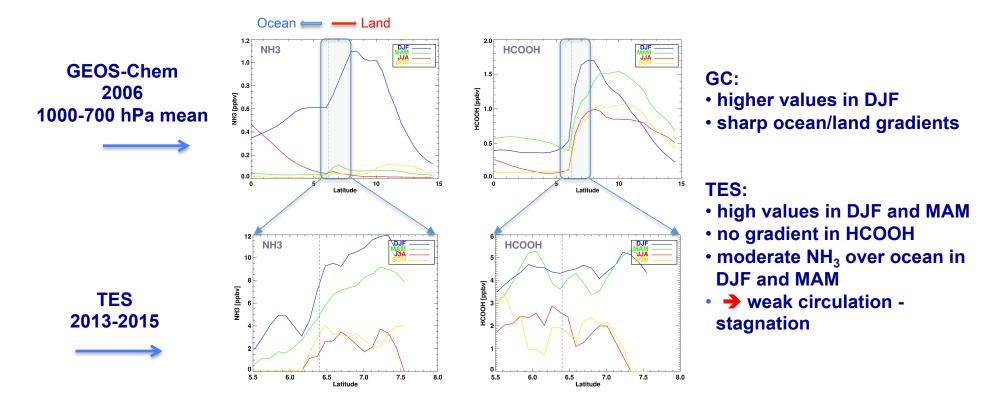

Slow circulation - reduced venting

TES transect means

Seasonal Means

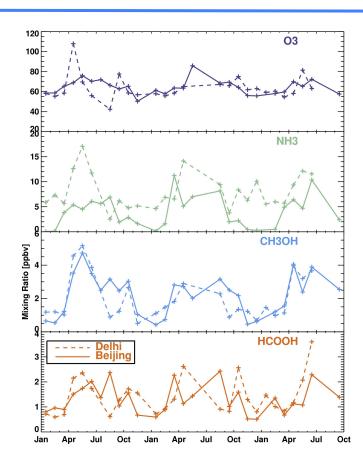

A Tale of Two Cities

Beijing

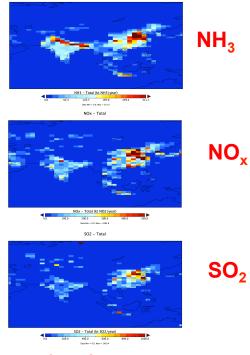

Delhi

- Similar O3 and CO levels
- Why is NH₃ different?

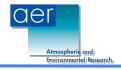

ECLIPSE v5 emissions

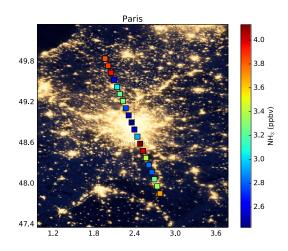

Summary

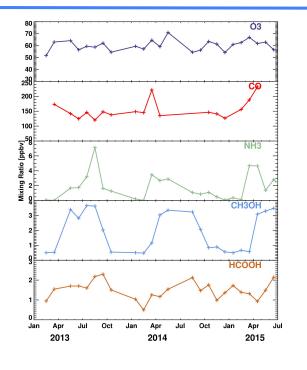

- TES has collected data from January 2013 to April 2016 over 19 megacities
- Data are closely spaced (12 km) and are taken approximately every two weeks
- Species measured: O₃, CH₄, NH₃, CH₃OH, HCOOH, HDO, PAN, CO₂
- Data point to influences of biomass burning and other pollution sources
- Also show different chemistry regimes in different cities
- On going work uses the new AIRS-OMI O3 product to provide context for interpreting the TES megacity measurements
- Data are available on AVDC

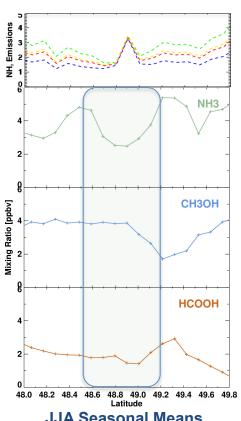

Paris

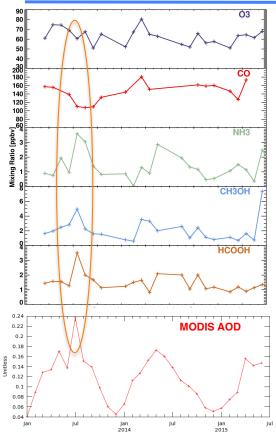

HTAP and TES disagree on source of NH₃

JJA Seasonal Means

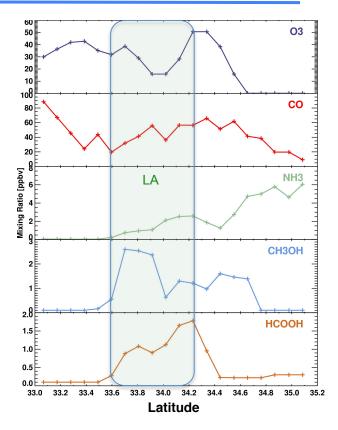

Los Angeles puzzle - 1

High NH₃, CH₃OH and HCOOH in July 2013 correlate with higher AOD, but not with CO or O₃

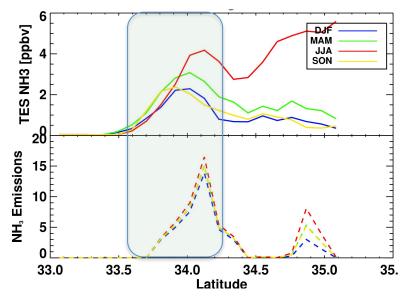

- •Early fire season
- •But not from fire?
- •HCOOH, CH₃OH generated locally over LA
- •NH₃ has different source

August 2013

Los Angeles puzzle - 2

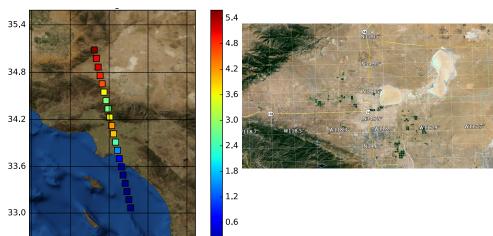

TES NH₃ and HTAP emissions peak within city

High JJA TES peak north of the city

—HTAP underestimates NH₃ emissions here

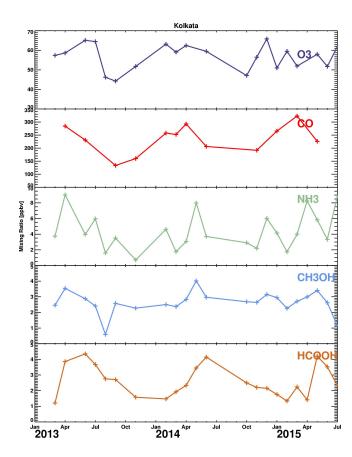

TES JJA NH₃transect

-119.4 -118.8 -118.2 -117.6 -117.0

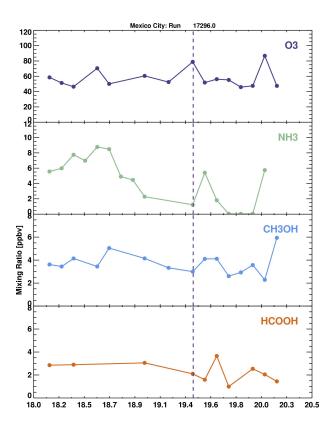

Kolkatta

May 25 – Lower pollution

- Lower HCOOH
 is consistent
 with less
 transport over
 fires
- Model O₃
 profile points
 to mix of local
 production and
 transport

- High HCOOH and NH3 south of city point to BB influence there
- Lower HCOOH further north city suggests transported BB is not major contributor
- Model O₃ profile points to local production
